

Golanta

Golanta was a *one week* challenge to build a [Golang](#) web server on the theme of [Koh-Lanta](#), a famous TV show in France.

It was very tiring and intense, mostly because of the CRUD based structure, the use of JSON as database and the required appealing front-end.

I remember hours of HTML - CSS programming to do simple character cards.

You can see the result [here](#). Just make sure to not use a dark theme plugin on your browser, it may break the stylesheets of the website.

You can find the code on my [Github repository](#).
